# Intermediate CUDA® Programming

Jian Tao

jtao@tamu.edu

Fall 2017 HPRC Short Course

10/31/2017

## Relevant Short Courses and Workshops

#### **Introduction to CUDA Programming**

https://hprc.tamu.edu/training/intro\_cuda.html

#### **Bring-Your-Own-Code Workshop**

https://coehpc.engr.tamu.edu/byoc/

Offered regularly

## CUDA Programming Abstractions

## **Key Programming Abstractions**

Three key abstractions that are exposed to CUDA programmers as a minimal set of language extensions:

- a hierarchy of thread groups
- shared memories
- barrier synchronization

## Glossary

- Thread is an abstract entity that represents the execution of the kernel, which is a small program or a function.
- Grid is a collection of Threads. Threads in a Grid execute a Kernel Function and are divided into Thread Blocks.
- Thread Block is a group of threads which execute on the same multiprocessor (SMX). Threads within a Thread Block have access to shared memory and can be explicitly synchronized. 5

#### **CUDA Kernels**

- CUDA kernels are C functions that, when called, are executed N times in parallel by N different CUDA threads.
- A kernel is defined with \_\_global\_\_ declaration specifier.

```
// Kernel definition
__global__ void VecAdd(float* A, float* B, float* C)
{
  int i = threadIdx.x;
  C[i] = A[i] + B[i];
}
```

#### **Kernel Invocation**

- The number of CUDA threads that execute a kernel is specified using a new <<<...>>>execution configuration syntax.
- Each thread that executes the kernel is given a unique thread ID that is accessible within the kernel through the built-in 3-component vector threadIdx.

```
// Kernel Invocation with N threads
VecAdd<<<1, N>>>(A, B, C);
```

### **Example 1 - Kernel Definition**

```
// Kernel definition
 global void MatAdd(float A[N][N], float B[N][N],
float C[N][N])
  int i = threadIdx.x;
  int j = threadIdx.y;
 C[i][j] = A[i][j] + B[i][j];
```

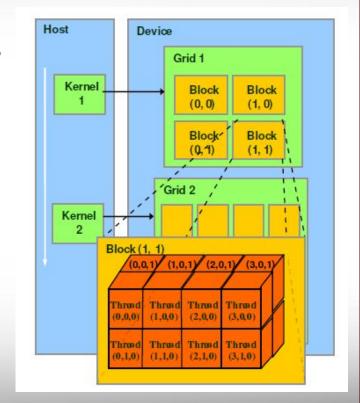

#### **Example 1 - Kernel Invocation**

```
// Kernel invocation
int main()
// Call kernel with one block of N * N * 1 threads
  int numBlocks = 1;
  dim3 threadsPerBlock(N, N);
  MatAdd<<<numBlocks, threadsPerBlock>>>(A, B, C);
```

## **Hierarchy of Threads**

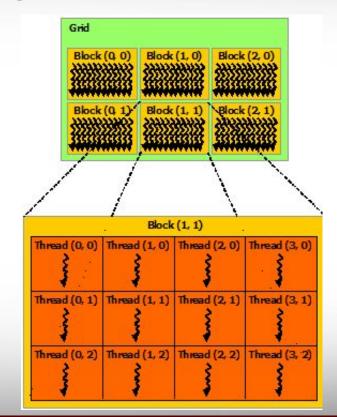

### **Thread Hierarchy - I**

- 1D, 2D, or 3D threads can form 1D,
   2D, or 3D thread blocks.
- 1D, 2D, or 3D blocks can form 1D,
   2D, or 3D grid of thread blocks
- The number of threads per block and the number of blocks per grid are specified in the <<<...>>> syntax.

## **Thread Hierarchy - II**

- Each block within the grid can be identified by an index accessible within the kernel through the built-in 3-component vector blockIdx.
- The dimension of the thread block is accessible within the kernel through the built-in 3-component vector blockDim.

#### **Thread Index and Thread ID**

- 1D thread ID is the same as the index of a thread
- 2D
  for a two-dimensional block of size (blockDim.x, blockDim.y),
  the thread ID of a thread of index (x, y) is (x + y \* blockDim.x)
- 3D
   for a three-dimensional block of size (blockDim.x, blockDim.y, blockDim.z), the thread ID of a thread of index (x, y, z) is (x + y \* blockDim.x + z \* blockDim.x \* blockDim.y)

#### **Indexing Arrays with Blocks and Threads**

Consider indexing an array with one element per thread (8 threads/block)

```
threadIdx.x threadIdx.x threadIdx.x threadIdx.x 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6 7 0 1 2 3 4 5 6
```

With blockDim.x threads/block, the thread is given by:
 int index = threadIdx.x + blockIdx.x \* blockDim.x;

## **Indexing Arrays: Example**

Which thread will operate on the red element?

```
9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31
                                      threadIdx.x = 5
 blockDim.x = 8
                                blockIdx.x = 2
int index = threadIdx.x + blockIdx.x * blockDim.x;
             = 21
```

### **Example 2 - Kernel Definition**

```
// Kernel definition
 qlobal void MatAdd(float A[N][N], float B[N][N],
float C[N][N])
  int i = blockIdx.x * blockDim.x + threadIdx.x;
  int j = blockIdx.y * blockDim.y + threadIdx.y;
  if (i < N && j < N)
   C[i][j] = A[i][j] + B[i][j];
```

#### **Example 2 - Kernel Invocation**

```
// Kernel invocation
int main()
// run kernel with multiple blocks of 16*16*1 threads
  dim3 threadsPerBlock(16, 16);
  dim3 numBlocks(N / threadsPerBlock.x, N /
threadsPerBlock.y);
  MatAdd<<<numBlocks, threadsPerBlock>>>(A, B, C);
```

## **Handling Arbitrary Vector Sizes**

- Typical problems are not friendly multiples of blockDim.x
- Avoid accessing beyond the end of the arrays:

```
__global__ void VecAdd(int *A, int *B, int *C, int n) {
    int index = threadIdx.x + blockIdx.x * blockDim.x;
    if (index < n)
        C[index] = A[index] + B[index];
}
Update the kernel launch: M = blockDim.x
        VecAdd<<<(N + M-1) / M, M>>>(A, B, C, N);
```

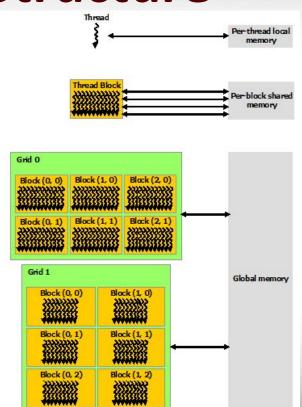

#### Why Bother with Threads?

- Threads seem unnecessary
  - They add a level of complexity
  - What do we gain?
- Threads within a block can cooperate by sharing data through some shared memory
- by synchronizing their execution to coordinate memory accesses with syncthreads()

## **Memory Hierarchy**

### **Hierarchical Memory Structure**

- Each thread has access to **registers** and **private local memory**.
- Each thread block has shared
   memory visible to all threads of the
   block and with the same lifetime as
   the block.
- All threads have access to global memory.

#### **Memory Spaces**

- Register, local, shared, global, constant (read only), and texture (read only) memory are the memory spaces available.
- Only register and shared memory reside on GPU.
- The global, constant, and texture memory spaces are cached and persistent across kernel launches by the same application.

#### **Memory: Scope and Performance**

- Data in register memory is visible only to the thread and lasts only for the lifetime
  of that thread.
- Local memory has the same scope rules as register memory, but performs slower.
- Data stored in **shared memory** is visible to all threads within that block and lasts for the duration of the block.
- Data stored in **global memory** is visible to all threads within the application (including the host), and lasts for the duration of the host allocation.
- **Constant memory** is used for data that will not change over the course of a kernel execution and is read only.
- **Texture memory** is another variety of read-only memory on the device.

## **Using Global Memory**

- Linear memory is typically allocated using cudaMalloc() and freed using cudaFree() and data transfer between host and device is done using cudaMemcpy().
- Linear memory can also be allocated through cudaMallocPitch() and cudaMalloc3D() and transferred using cudaMemcpy2D() and cudaMemcpy3D() with better memory alignment.

## **Using Shared Memory**

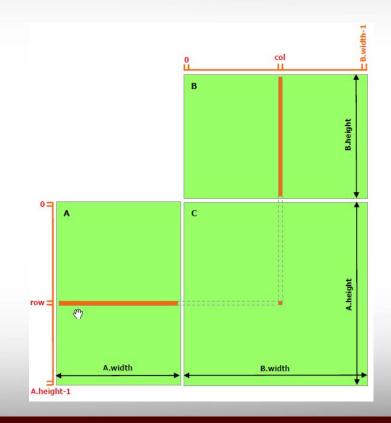

- Much faster than global memory.
- Allocated using the \_\_shared\_\_ memory space specifier.

```
__shared__ float A[BLOCK_SIZE] [BLOCK_SIZE];
```

 Shared memory shall be used as a cache for global memory to exploit locality of the code.

#### **Example 3 - Matrix Multiplication w/o SM**

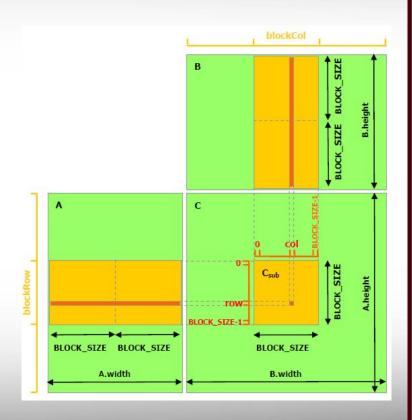

Each thread computes one element of C by accumulating results into Cvalue.

#### **Example 4 - Matrix Multiplication with SM**

Each thread computes one element of Csub // by accumulating results into Cvalue

```
for (int m = 0; m < (A.width / BLOCK_SIZE); ++m) {
    Matrix Asub = GetSubMatrix(A, blockRow, m);
    Matrix Bsub = GetSubMatrix(B, m, blockCol);
    __shared__ float As[BLOCK_SIZE][BLOCK_SIZE];
    __shared__ float Bs[BLOCK_SIZE][BLOCK_SIZE];
    As[row][col] = GetElement(Asub, row, col);
    Bs[row][col] = GetElement(Bsub, row, col);
    __syncthreads();
    for (int e = 0; e < BLOCK_SIZE; ++e)
        Cvalue += As[row][e] * Bs[e][col];
    __syncthreads();
}</pre>
```

#### Review - 1

- Launching parallel kernels
  - Launch n copies of add() with add<<<n/м,м>>>(...);
  - Use blockIdx.x to access block index
  - Use threadIdx.x to access thread index within block
- Allocate elements to threads:

```
int index = threadIdx.x + blockIdx.x * blockDim.x;
```

#### Review - 2

- Launching parallel threads
  - Launch N blocks with blockDim.x threads per block with kernel<<<N, blockDim.x>>> (...);
  - Use blockIdx.x to access block index within grid
  - Use threadIdx.x to access thread index within block
- Allocate elements to threads:

```
int index = threadIdx.x + blockIdx.x * blockDim.x
```

#### Review - 3

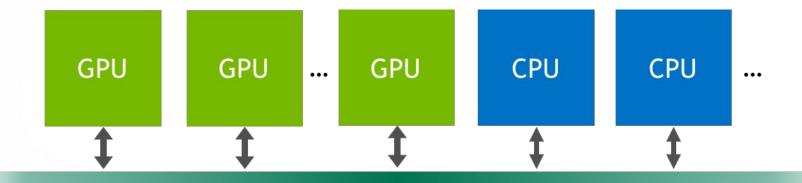

- Use <u>\_\_shared\_\_</u> to declare a variable/array in shared memory
  - Data is shared between threads in a block
  - Not visible to threads in other blocks
- Use \_\_syncthreads() as a barrier
  - Use to prevent data hazards

## **Unified Memory Programming**

## **Unified Memory**

Software: CUDA 6.0 in 2014

Hardware: Pascal GPU in 2016

**Unified Memory** 

### **Unified Memory**

- A managed memory space where all processors see a single coherent memory image with a common address space.
- Eliminates the need for cudaMemcpy ().
- Enables simpler code.
- Equipped with hardware support since Pascal.

#### Example 5 - Vector Addition w/o UM

```
global void VecAdd(int *ret, int a, int b) {
   ret[threadIdx.x] = a + b + threadIdx.x;
int main() {
   int *ret;
   cudaMalloc(&ret, 1000 * sizeof(int));
   VecAdd<<< 1, 1000 >>>(ret, 10, 100);
    int *host ret = (int *)malloc(1000 * sizeof(int));
    cudaMemcpy(host ret, ret, 1000 * sizeof(int), cudaMemcpyDefault);
    for(int i=0; i<1000; i++)</pre>
       printf("%d: A+B = %d\n", i, host ret[i]);
    free(host ret);
   cudaFree(ret);
   return 0;
```

#### **Example 6 - Vector Addition with UM**

```
global void VecAdd(int *ret, int a, int b) {
    ret[threadIdx.x] = a + b + threadIdx.x;
int main() {
    int *ret;
    cudaMallocManaged(&ret, 1000 * sizeof(int));
    VecAdd<<< 1, 1000 >>>(ret, 10, 100);
    cudaDeviceSynchronize();
    for(int i=0; i<1000; i++)</pre>
        printf("%d: A+B = %d\n", i, ret[i]);
    cudaFree(ret);
    return 0;
```

## **Example 7 - Vector Addition with Managed Global Memory**

```
device managed int ret[1000];
global void VecAdd(int *ret, int a, int b) {
   ret[threadIdx.x] = a + b + threadIdx.x;
int main() {
   VecAdd<<< 1, 1000 >>>(ret, 10, 100);
   cudaDeviceSynchronize();
   for(int i=0; i<1000; i++)</pre>
       printf("%d: A+B = %d\n", i, ret[i]);
   return 0;
```

## **Managing Device**

## **Coordinating Host & Device**

- Kernel launches are asynchronous
  - Control returns to the CPU immediately
- CPU needs to synchronize before consuming the results

cudaMemcpy ()

Blocks the CPU until the copy is complete. Copy

begins when all preceding CUDA calls have

completed

cudaMemcpyAsync() Asynchronous, does not block the CPU

cudaDeviceSynchronize() Blocks the CPU until all preceding CUDA calls have

completed

#### Reporting Errors

- All CUDA API calls return an error code (cudaError\_t)
  - Error in the API call itself or
  - Error in an earlier asynchronous operation (e.g. kernel)
- Get the error code for the last error: cudaError\_t cudaGetLastError(void)
- Get a string to describe the error:

```
char *cudaGetErrorString(cudaError_t)
printf("%s\n",cudaGetErrorString(cudaGetLastError());
;
```

## **Device Management**

Application can query and select GPUs

```
cudaGetDeviceCount(int *count)
cudaSetDevice(int device)
cudaGetDevice(int *device)
cudaGetDeviceProperties(cudaDeviceProp *prop, int device)
```

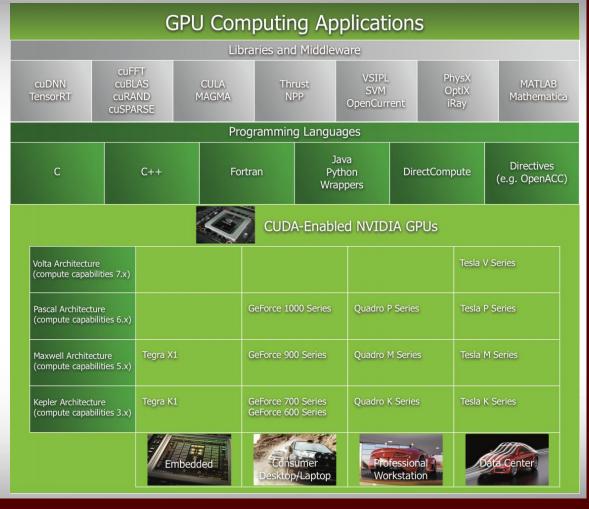

- Multiple threads can share a device
- A single thread can manage multiple devices

```
Select current device: <a href="mailto:cudaSetDevice">cudaSetDevice</a>(i)
For peer-to-peer copies: <a href="mailto:cudaMemcpy">cudaMemcpy</a>(...)
```

## **GPU Computing Capability**

The compute capability of a device is represented by a version number that identifies the features supported by the GPU hardware and is used by applications at runtime to determine which hardware features and/or instructions are available on the present GPU.

## **Appendix**

#### 1D Grid of Blocks in 1D, 2D, and 3D

```
device int getGlobalIdx 1D 1D ()
return blockIdx.x * blockDim.x + threadIdx.x;
device int getGlobalIdx 1D 2D ()
return blockIdx.x * blockDim.x * blockDim.y + threadIdx.y * blockDim.x +
  threadIdx.x;
device int getGlobalIdx 1D 3D ()
return blockIdx.x * blockDim.x * blockDim.y * blockDim.z
  + threadIdx.z * blockDim.y * blockDim.x + threadIdx.y * blockDim.x +
  threadIdx.x;
```

#### 2D Grid of Blocks in 1D, 2D, and 3D

```
device int getGlobalIdx 2D 1D ()
int blockId = blockIdx.y * gridDim.x + blockIdx.x;
int threadId = blockId * blockDim.x + threadIdx.x;
return threadId;
device int getGlobalIdx 2D 2D ()
int blockId = blockIdx.x + blockIdx.y * gridDim.x;
int threadId =
 blockId * (blockDim.x * blockDim.y) + (threadIdx.y * blockDim.x) + threadIdx.x;
return threadId;
device int getGlobalIdx 2D 3D ()
int blockId = blockIdx.x + blockIdx.y * gridDim.x;
int threadId = blockId * (blockDim.x * blockDim.y * blockDim.z)
  + (threadIdx.z * (blockDim.x * blockDim.y))
  + (threadIdx.y * blockDim.x) + threadIdx.x;
return threadId;
```

#### 3D Grid of Blocks in 1D, 2D, and 3D

```
device int getGlobalIdx 3D 1D ()
int blockId = blockIdx.x
  + blockIdx.y * gridDim.x + gridDim.x * gridDim.y * blockIdx.z;
int threadId = blockId * blockDim.x + threadIdx.x;
return threadId;
device int getGlobalIdx 3D 2D ()
int blockId = blockIdx.x
  + blockIdx.y * gridDim.x + gridDim.x * gridDim.y * blockIdx.z;
int threadId = blockId * (blockDim.x * blockDim.y)
  + (threadIdx.y * blockDim.x) + threadIdx.x;
return threadId;
device int getGlobalIdx 3D 3D ()
int blockId = blockIdx.x
  + blockIdx.y * gridDim.x + gridDim.x * gridDim.y * blockIdx.z;
int threadId = blockId * (blockDim.x * blockDim.y * blockDim.z)
  + (threadIdx.z * (blockDim.x * blockDim.y))
  + (threadIdx.y * blockDim.x) + threadIdx.x;
return threadId;
```
